

Online Appendix for “Don’t Call It a Comeback: Autocratic Ruling Parties after Democratization”

British Journal of Political Science

Michael K. Miller

The following pages display additional information and robustness checks referenced in the text. For convenience, I list a summary of these checks:

- **Table A1** lists all of the autocratic ruling parties in the sample, including the year of democratization, whether there was a violent break before transition, and the party’s outcomes within democracy.
- **Figure A1** displays the shift in the fraction of regimes with compulsory voting and independent judiciaries from before to after democratization, dividing by whether the parties acceded to democratization. As seen, parties that held power up to democratization were less likely to adopt both institutions, as they tended to make their continued dominance less likely.
- **Table A2** shows the main models, additionally controlling for modal regime types from the autocratic period (coded by Geddes et al. 2014). As shown in the paper, pure party regimes are strongly positive for success in democracy. More surprisingly, military parties (all regimes coded as military or military hybrids) are also positive, whereas personalist regimes (hybrids or pure) are negative for success. This captures the fact that personalist regimes tend to create relatively powerless, dependent parties that struggle to persist past the founding leader (Geddes 1999; Svobik 2012).
- **Table A3** shows the ordered logit models predicting *Party Success* (Table 2, Model 3), stratifying by modal regime type within autocracy. The four models in succession are limited to pure party regimes, not pure party regimes, military hybrids, and personalist hybrids. Although small sample sizes make comparisons difficult, most results are stable across

samples. An interesting difference is that *Party Years in Power* is significantly positive only for pure party regimes. The democracy's age is also negative for success, except for pure party regimes.

- **Table A4** shows several robustness checks for models predicting *Party Success*. Model 1 includes ruling parties that were not last in the autocratic spell as separate observations. Unsurprisingly, the number of years out of power prior to democratization is strongly negative for later success. Models 2-4 restrict the sample to democratic election years only, parties that were in power in autocracy at least five years, and democracies 10 years old or less. Results are highly robust across the samples. Models 5 and 6 stratify by whether the party was violently ousted prior to democratization. Party years in power and opposition freedom are positive for later success only when the party was ousted.
- **Table A5** shows robustness checks for models predicting *Party Success*, limiting the sample using alternative democracy measures. For comparison, Model 1 shows the full sample (Model 3, Table 2), which uses the Boix et al. (2013) measure. Model 2 further restricts the sample to countries with a Polity score 6 or above (Marshall and Jaggers 2017), the typical threshold for democracy. Model 3 requires the Freedom House (2016) rating for both political rights and civil liberties to be at 3 or below. Model 4 requires the V-Dem rating for polyarchy to be above 0.5 (on a 0-1 scale), the value that roughly makes the BMR coding more likely than not to be a democracy. Thus, Models 2-4 apply more demanding requirements for being included in the democracy sample. Results are highly robust.
- **Table A6** shows the results for the instruments in the first stages of the instrumental variables models (Table 5). Across the three endogenous (instrumented) variables, the party's average economic growth, freedom from repression, and provision of equal resources is positive for later democratic success, whereas average corruption is negative. The averages are all taken from the party's autocratic ruling period. Current values of each variables are controlled for in the democracy sample to maintain the exclusion restriction.
- **Table A7** shows several robustness checks for the instrumental variables models, adapting the models shown in Table 5. Separate checks are between the dashed lines, with the coefficients shown for the endogenous variables, as well as additional controls for some checks.
 - The first two checks vary the length of the lagged DV control for the liberal index models. Instead of five years, it uses two or ten years. The results are robust.

- The next three checks use alternative measures of democracy. As described above, it limits the sample to democracies that also meet requirements for Polity, Freedom House, and V-Dem. This is used to define democratic survival and to restrict the sample. Results are robust, with the exception of results narrowly missing significance for the liberal index in the Freedom House alternative. This is partly because this is the smallest sample, increasing the standard errors.
- The next check restricts the sample to democracies at least five years old. This ensures that the five-year lag for the liberal index comes from the democratic period. These results are robust. The results for democratic survival remain negative, but now miss significance.
- The next check adds dummies for the holding of a legislative election and executive election. As seen, the results for party performance remain significantly negative. Legislative election years have no effect, but years with executive elections are more likely to see improved democratic quality and chances for survival.
- The penultimate check only counts autocratic parties that ruled in the immediately prior autocratic spell, whereas the other models use the most recent autocratic ruling party. Results are very similar.
- The final check includes all democratic years, even without prior autocratic parties. To allow the IV setup to run, the instruments are set at the average values for the sample for the non-party observations. Party success remains negative. However, having an autocratic party in the past is positive for democratic survival, indicating the benefit of electoral experience.

Table A1: Autocratic Ruling Party List

Country	Party	Year of Dem.	Break Before Dem.	Party Remains	Party Competitive	Party Gains Power

Notes: The table lists the 84 ruling parties in this paper's main sample. Each is the last ruling party in the autocratic spell before democratization. Also shown is the year of democratization, whether there was a violent break between party control and democracy, and whether the party remained, was competitive, and regained power at any point in the following democratic spell. Parties with name changes are considered a continuation. A * indicates that the original party does not qualify, but an altered form of the party does.

Compulsory Voting

Independent Judiciaries

Figure A1: The figures show the prevalence of compulsory voting and independent judiciaries five years before democratization and following democratization, divided by whether an autocratic ruling party was in power at democratization or was first ousted and replaced by an intervening regime. The comparison shows that both political rules were much less common if the ruling party had leverage over the transition process.

Table A2: Additional Models of Ruling Party Success after Democratization (Regime Types)

DV =	Logit / Ordered Logit			Heckman Selection Models		
	(1) Party Competitive	(2) Party In Power	(3) Party Success	(4) Party Competitive	(5) Party In Power	(6) Party Success

	Party Competitive (1)	Party in Power (2)	Party Success (3)
<i>Party Average Growth</i>	0.019*** (5.19)	0.009** (3.25)	0.023** (2.76)
<i>Party Average Freedom from Repression</i>	0.413** (3.02)	0.078 (0.47)	0.757* (2.14)
<i>Party Average Corruption</i>	-1.184*** (-4.68)	-0.538 (-1.85)	-2.414*** (-3.82)
<i>Party Average Equal Resources</i>	0.731*** (4.53)	0.618*** (3.51)	1.916*** (4.68)
Other Controls?	Y	Y	Y
N	1,644	1,644	1,644
Countries	66	66	66
Kleibergen-Paap F (1st stage)	32.45	8.04	19.74
Overid. Test (Hansen J p-value)	0.14	0.58	0.57

Notes: The table displays coefficients on the four instruments from the first stages of the IV models in Models 1-3 of Table ???. The second-stage controls are included, but not shown. Years are 1940–2012. *t* statistics (based on robust standard errors clustered by electoral period) are in parentheses.

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Table A7: Robustness Checks for IV Models Predicting Democratic Survival and Liberalism

DV =	Democratic Survival			Liberal Index (V-Dem)		
Endogenous Variable =	Party Competitive (1)	Party in Power (2)	Party Success (3)	Party Competitive (4)	Party in Power (5)	Party Success (6)
2-year DV Lag				-0.046*** (-3.49)	-0.090*** (-3.30)	-0.024*** (-3.73)
10-year DV Lag				-0.100*** (-4.17)	-0.199*** (-3.87)	-0.050*** (-4.39)
Alt Dem: Polity	-1.169* (-2.28)	-1.862** (-2.82)	-0.570* (-2.39)	-0.080** (-3.22)	-0.187** (-3.00)	-0.046*** (-3.46)
Alt Dem: Freedom House	-1.214* (-2.38)	-1.987*** (-4.42)	-0.577** (-2.63)	-0.030 (-1.82)	-0.051 (-1.50)	-0.017 (-1.86)

All Dem. Years	-1.503*** (-5.67)	-2.165*** (-8.52)	-0.710*** (-5.80)	-0.067*** (-4.35)	-0.104*** (-3.76)	-0.037*** (-4.82)
<i>Past Autocratic Party</i>	0.606** (3.24)	0.593*** (4.27)	0.814*** (4.20)	0.004 (0.35)	0.002 (0.23)	0.018 (1.51)

Notes: The table displays robustness checks for the IV models testing how autocratic ruling party success influences democratic survival (Models 1–3) and quality (Models 4–6). The endogenous variables that are instrumented also vary by model. Different checks are listed at left and separate IV results are shown for each check, endogenous variable, and dependent variable. Years are 1940–2012. *t* statistics (from robust standard errors clustered by electoral period) are in parentheses. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$
